# S@FETRACK©

S@feTrack is the proprietary Safety21's platform for the census of car crashes.

The platform is designed to provide the Police Force and experts a versatile tool for the preparation of accident report, in electronic format on the Android Tablet.

Integrated with TITAN©, S@feTrack allows the creation of an accident files in PDF format and their distribution through a portal with restricted access to insurance companies, leading victims and third parties involved.

S@feTrack enables Police Forces to accurately collect in a very intuitive way all useful details on the dynamics, context and characteristics of each road accident, information that can be used for different purposes. One of these is **the creation of a database wich can provide statistics that can improve traffic management and road safety** - responsibility of the individual Administration - identifying, for example, the most dangerous road sections, those in which statistically occur the most number of accidents.

With this information it will be possible to act by improving the signs, installing speed detection devices and putting in place all those targeted measures to reduce the risks arising from cars circulation.

DISTINCTIVE FEATURES

Digital
Intuitive software for Road accident detection and accident reports drafting.

Simple
With a few simple steps you may collect incident's data and create automatically a report in PDF format.

Data Base Statistics
The integration with the TITAN© platform allows to create statistics for the improvement of road safety and traffic management.

Accurate
It allows authorities to intuitively and accurately collect all useful details on dynamic, context and characteristics of each road accident.

Immediate
The report is available immediately through a portal with restricted access to victims, third parties involved, insurance companies.
